

Criterion A: Planning

Scenario

The client is Jill Cruz. Since my client takes part in baking, we discussed if she had an issue when it came to her hobby. We discussed if she had a problem when it came to catering to family events and her community events. Jill enjoys baking pastries, but the problem arises when it comes to recipes. My client must look through the internet to find recipes as she loses any written or copied recipes. This is ineffective as she tends to experiment and changes up the original recipe and her baking is never the same each time. When she would write down her recipes, it would become unorganized and she could never find the recipe she wanted. She believes that having everything connected to a database would be easier. This would make organizing her recipes easier and does not use up paper. The client is requesting for a product that will contain basic information about the pastry, the recipe, and an organization system.

Rationale for Proposed Solution

The proposed solution is a database that will contain a HUD of five pastries types. Within each category, there will be many specific pastries that the user can select. This will allow for an organization system to be in place, as my client struggled with that before. It will allow my client to edit the recipes as she experiments with the recipes and changes them up. It will save paper and keep all of her recipes in an easy access location. The search and filter option will allow her to not have to look through multiple different recipes to find the one she wants.

I have decided to make a GUI with buttons for basic viewing. This is to reduce complexity within the program as instead of inputting to navigate through the database. I decided to use Java because of how object oriented it is. This will let me reuse my code, reducing abstraction.

Database Success Criteria (Note these labels are referenced in later criterions)

- Feature to find and search/sort for pastries - **DB1**
- Displays list of individual pastries - **DB2**
- Displays basic information about the pastry -**DB3**
- Feature to add or delete - **DB4**
- Feature to edit pastries - **DB5**

Client Specific Criteria (Note these labels are referenced in later criterions)

- Separates different pastries into five different categories - **CS1**
- Search for ingredients - **CS2**
- Sort and search for names - **CS3**
- Sort by cost - **CS4**
- Create a menu to easily access the different parts of the code - **CS5**
- Randomly picks a pastry when prompted - **CS6**
