

Criterion E: Evaluation

Evaluation of the Product (Note the labels outlined in Criterion A)

Success Criteria outlined in Criterion A:

- **DB1**
 - Met since client is able to sort through the code and find specific pastries
- **DB2**
 - Met since program displays list according to category
- **DB3**
 - Met since client can view information about pastry
- **DB4**
 - Met since client is able to add more pastries and delete any old ones
- **DB5**
 - Met since client has access to editing a specific pastry
- **CS1**
 - Met since program organizes all pastries into the five pastry categories
- **CS2**
 - Met since client can pick search up ingredients
- **CS3**
 - Met since client has the ability to sort alphabetically and reverse alphabetically
- **CS4**
 - Met since client can sort through the cost per serving
- **CS5**
 - Met since client can use the return menu to go to different parts of the program

- **CS6**

- Met since user can pick a random pastry when it comes to display

Recommendations

The appendix references my last consultation with my client. My client recommended that I add more labels and warning screens. She thinks the ability to view multiple recipes at once is a good suggestion. Also a way to cancel out of the current window regardless of where I am. Also with how the program doesn't account for serving size or if the recipe gets too long.

I will implement the things my client recommended. With the ability to view multiple recipes, I need a way to clear all of them. Another way to improve making recipes is to provide a way to create copies of a pastry. This would make experiments easier, benefitting my client. A feature to automatically delete or edit a recipe when the client selects it helps with organization. If my client does decide to start using the program for her events, I will add in two sections of the database, one for her clients and her personal one. The personal one should be locked by a password just in case as anyone with access to it can permanently delete her recipes. I think there can be more information in the file, like time to cook or portions. More options to sort or search by, like sorting by ingredients. If I implemented more information to display, like time, I can add a way to sort by that too. I think a way to increase complexity would be adding in the feature to convert measurements. Then, if my client is making multiple batches, she can input how many portions she wants and the code will automatically multiply the number of ingredients and the cost to buy the ingredients.

Further Development

Further development of the product would be implementing the above changes. More development would change how the program fits and looks. The steps would be very user-based to create a better experience for my client.
